### **Trenton Forging Fuels Greenhouse By Acting Green**

**Trenton, MI** – Trenton Forging has placed themselves at the forefront of green building. They have taken the spreading green idea to create a rooftop greenhouse, using it to advance their environmental impact.

The company discovered an innovative way to process unused energy, a natural byproduct from the manufacturing process. Trenton Forging is using this energy to heat water that fuels a greenhouse, which is located on the roof of the company's plant. As a result, produce is already flourishing in the garden.

"Since our inception, Trenton Forging has been committed to making a difference in the world around us," said David Moxlow, president. "It only makes sense to find a renewable use for unused energy. We're excited about continuing to move forward in our efforts to enhance our environment."

The 1,600 square foot structure acts as a natural eco scrubber taking a previously unused resource and transforming it into a harvest of over 1,400 plants including: lettuce, spinach, kitchen herbs, tomatoes, and flowers.

Trenton Forging serves customers ranging from small component suppliers to Fortune 500 OEMs. Some of the industries served include: agriculture, automotive/truck, architectural/building, construction, marine, defense, mining and racing.

The Trenton Forging Web site has several pictures of the Rooftop Greenhouse at [www.trentonforging.com](http://www.trentonforging.com).
